

from other ontologies. OMDoc tools can identify missing imports.

Imports can carry morphisms.

Classes, properties, and individuals are declared as symbols, having a type.

Informal sections and descriptions can be included right into the ontology document.

Formal and informal contant of a statement

## **Theory** (FOAF)

**Imports**: OWL, First Order Logic WordNet, Dublin Core (*dc:creator*  $\mapsto$  *maker*), ...

## Classes

Symbol (Project): Project: owl:Class

The Project class represents the Projects' of things that are 'projects'. These may be formal or informal, collective or individual. It is often use-

ful to indicate the *menopage* of a *Project*. **Axiom:** *Project*  $\sqsubseteq$  *wordnet:Project* We reuse and specialize WordNet's project class.

**Axiom:**  $Project \square Document = \bot$ 

A Project is not a Document.

	We have formalized
	RDF, RDFS, and OWL
	(symbols and partial
	semantics) as theories.
	From a single OMDoc
	source, we can obtain:
	• various formal repre-
	sentations
,	• various human-
,	readable presentations

tent of a statement can
be given in parallel and
Seross-linked.

Custom symbol notations: •  $owl:disjointWith(A, B) \vdash$  $A \sqcap B = \bot$ • foaf:member(g, m)  $\vdash$  $g \ni_{member} m.$ 

We use compound property types to declare range and domain.

A lot about inverse properties can be inferred from the original property and the inverseness dec-

Symbol (made):

made:  $owl:ObjectProperty(Agent \rightarrow owl:Thing)$ The made property relates an *Agent* to something *made* by it.

http://kwarc.info/projects/krextor/

**Symbol (maker):** *maker* (no declared type; see below) **Axiom:**  $made = maker^{-}$ 

**Type Assertion:** maker:  $owl:ObjectProperty(owl:Thing \rightarrow Agent)$ **Proof:** We prove this using the declared type of *foaf:made*, using axiom ..., and the OWL direct semantics of *mowl:inverseOf*.

**Lemma:** *maker* = *made*<sup>-</sup>

**Proof:** 

1. We know that *made* = *maker*<sup>-</sup> 2. Interpreted using the OWL semantics, this means that  $made^{L} =$  $(maker^{-})^{\mathcal{I}} = (maker^{\mathcal{I}})^{-}$ 

3. Now we apply the inverse on both sides, eliminate double inverses, and obtain  $(made^{\mathcal{I}})^{-} = ((maker^{\mathcal{I}})^{-})^{-} = maker^{\mathcal{I}}$ 4. This is the interpretation of *maker* = *made*<sup>-</sup>, which we had to prove. **Axiom:**  $\forall t, m, n. maker(t, m) \land name(m, n) \Rightarrow dc:creator(m, n)$ **Symbol (membershipClass):** The *membershipClass* property relates a Group to an RDF class representing a sub-class of Agent whose instances are all the agents that are a  $\mathbb{F}$  member of the  $\mathbb{F}$  Group. Axiom:  $\forall m, g, C. g \ni_{member} m \land membershipClass(g, C) \Rightarrow m :_{rdf:type} C$ Links http://www.omdoc.org http://kwarc.info/projects/swim/ http://jomdoc.omdoc.org/wiki/JOBAD

laration, using the OWL axioms.

Proofs can be given, but are optional.

We can add axioms that refine imported concepts.

By importing other logics, we can exceed OWL's expressivity.
