

# Towards Knowledge Management for HOL Light

Cezary Kaliszyk    Florian Rabe

University of Innsbruck, Austria

Jacobs University, Bremen, Germany

MKM 2014

# Motivation 1: System Compatibility

- ▶ Developments in one system can be used in another
  - ▶ shared library / library translations
- ▶ In practice: Most systems are not compatible
  - ▶ Typically only the system can parse its library
- ▶ Positive exceptions
  - ▶ Matita and Coq shared the format once
  - ▶ Various Translations (HOL Light  $\rightarrow$  Isabelle/HOL)

## Motivation 2: System Interoperability

- ▶ One system can be called while working in another one
- ▶ In practice: common for a main system to outsource ...
  - ▶ specialized tools  
e.g., decision procedures, theory exploration
  - ▶ automated provers, model finders  
e.g., use ATPs in proof assistant
  - ▶ computation systems  
use computer algebra system in deduction system
- ▶ ...but mostly ...
  - ▶ restricted to individual system pairs
  - ▶ brittle ad hoc connections
  - ▶ no symmetric interoperability

## Motivation 3: Library compatibility

$\mathbb{R}$  defined using:

- ▶ Cauchy sequences
- ▶ Dedekind cuts
- ▶ ...

Next talk

## Motivation 4: Library Management

- ▶ Same functionality needed in every system
  - ▶ browsing, navigation
  - ▶ distribution, versioning
  - ▶ search, querying
  - ▶ refactoring, change management
- ▶ Dilemma
  - ▶ typically not interesting for proof assistant developers
  - ▶ but necessary for large scale case studies
- ▶ Could be realized generically
- ▶ In practice: only system-specific ad hoc solutions (if any)

# The HOL Light System

- ▶ HOL Logic
  - ▶ Church simple type theory
  - ▶ Shallow polymorphism
  - ▶ Small inference system
    - ▶ 10 basic rules
    - ▶ 3 extension principles
- ▶ HOL Light kernel
  - ▶ LCF style
  - ▶ Private OCaml types for HOL types, terms, theorems
  - ▶ List references to store results of extensions

# The HOL Light Library

- ▶ HOL Light core system
  - ▶  $\mathbb{N}$ ,  $\mathbb{Z}$ ,  $\mathbb{R}$ , lists, sets
  - ▶ And their basic properties
  - ▶  $\approx 2,000$  theorems
- ▶ HOL Light standard library
  - ▶  $\mathbb{R}^{\mathbb{N}}$ , 100 theorems,  $\binom{n}{k}$ ,  $\lfloor x \rfloor$ , ...
  - ▶  $\approx 17,000$  theorems
- ▶ Flyspeck
  - ▶ Fans, Graphs, Packings, ...
  - ▶  $\approx 14,000$  theorems

# MMT

- ▶ Representation language for formal mathematical content
  - ▶ Foundation-independent
- ▶ Heterogeneous
  - ▶ Defining logical frameworks, logics, theorems in one syntax
- ▶ Implementation with generic
  - ▶ module system
  - ▶ parsing + type reconstruction
  - ▶ IDE
  - ▶ change management
- ▶ Category theory semantics
  - ▶ theories, morphisms, declarations, expressions
- ▶ Developed since 2007, > 30000 lines of Scala code
  - ▶ OMDoc/OpenMath-based XML syntax with Scala-based API
- ▶ Close relatives:
  - ▶ Fixed logical framework: LF, Isabelle, Dedukti
  - ▶ Hets: but declarative logic definitions

# Exporting the HOL Light Library

- ▶ Popular integration test case due to
  - ▶ simplicity of logic
  - ▶ size of the kernel
- ▶ Examples exports
  - ▶ to Isabelle/HOL Obua, 2006; Kaliszyk 2013
  - ▶ to OpenTheory Hurd, 2011
  - ▶ to Coq Keller, Werner, 2010
  - ▶ to Dedukti Dowek et al., 2013
- ▶ But: already the exports are adapted to the target system

# Approach

- ▶ Use MMT for logic, data and infrastructure
  1. LF represented and implemented within MMT
  2. HOL Light logic (kernel) represented as LF theory
    - ▶ (formalization of HOL Light kernel)
  3. Automatically exported HOL Light library
    - ▶ OMDoc theories
- ▶ All part of the same MMT theory graph

# The HOL LIGHT Logic in MMT/LF (1)

- ▶ One LF-type per concept
  - ▶ types, term, theorems
- ▶ Constructors for primitive operators
  - ▶ booleans, equality,  $\lambda$ -calculus

holtype : type

term : holtype  $\rightarrow$  type

thm : term bool  $\rightarrow$  type

bool : holtype

fun : holtype  $\rightarrow$  holtype  $\rightarrow$  holtype

Abs :  $\{A, B\}$  (term A  $\rightarrow$  term B)  $\rightarrow$  term (A  $\Rightarrow$  B)

Comb :  $\{A, B\}$  term (A  $\Rightarrow$  B)  $\rightarrow$  term A  $\rightarrow$  term B

equal :  $\{A\}$  term A  $\Rightarrow$  (A  $\Rightarrow$  bool)

## The HOL LIGHT Logic in MMT/LF (2)

- ▶ Curry-Howard: proofs as terms
- ▶ A constructor for each primitive proof rule

REFL :  $\{A, X:\text{term } A\} \vdash X = X$   
TRANS :  $\{A, X, Y, Z:\text{term } A\}$   
     $\vdash X = Y \rightarrow \vdash Y = Z \rightarrow \vdash X = Z$   
MP :  $p, q \vdash p = q \rightarrow \vdash p \rightarrow \vdash q$   
BETA :  $\{A, B, F:\text{term } A \rightarrow \text{term } B, X:\text{term } A\}$   
     $\vdash (\lambda F)'X = (F X)$   
MK\_COMB :  $\{A, B, F, G:\text{term } A \Rightarrow B, X, Y:\text{term } A\}$   
     $\vdash F = G \rightarrow \vdash X = Y \rightarrow \vdash F'X = G'Y$   
ABS :  $\{A, B, S, T:\text{term } A \rightarrow \text{term } B\}$   
     $(\{x:\text{term } A\} \vdash (S x) = (T x)) \rightarrow \vdash \lambda S = \lambda T$   
DEDUCT\_ANTISYM\_RULE  
    :  $\{p, q\} (\vdash p \rightarrow \vdash q) \rightarrow (\vdash q \rightarrow \vdash p) \rightarrow \vdash p = q$

## The HOL LIGHT Logic in MMT/LF (3)

One pattern declaration for each primitive extension principle

- ▶ Definition
- ▶ Type definitions
- ▶ (HOL axioms can be realized by meta axioms)

[Horozal, Kohlhase, Rabe, MKM 2012]

```
extension definition =
  [n: nat] [A: holtypen → holtype]
  [a: {T: holtypen} term (A T)]
  c    : {T} term (A T)
  DEF  : {T} ⊢ (c T) = (a T)

extension new_basic_type_definition =
  ...
```

## Exporting the Library

- ▶ Gathering an export list
  - ▶ Theories
  - ▶ Types, Constants, Definitions
  - ▶ Notations
- ▶ OMDoc theory file for each HOL Light file
  - ▶ MMT constants for types, constants, theorems

```
<constant name="PRE"><type>  
  <om:OMOBJ xmlns:om="http://www.openmath.org/OpenMath">  
    <om:OMS module="LF" name="apply"></om:OMS>  
    <om:OMS module="Kernel" name="term"></om:OMS>  
    <om:OMA>  
      <om:OMS module="LF" name="apply"></om:OMS>  
      <om:OMS module="Kernel" name="fun"></om:OMS>  
      <om:OMS module="nums" name="num"></om:OMS>  
      <om:OMS module="nums" name="num"></om:OMS>  
    </om:OMA>  
  </om:OMA></om:OMOBJ>  
</type></constant>
```

# Goal: Generic Library Management

- ▶ Library browser
  - ▶ MMT generates HTML (Presentation MathML)
  - ▶ interactive (JavaScript)
  - ▶ semantics-aware
    - e.g., dynamic type inference of subterms
  - ▶ cross-library browsing
- ▶ Search
  - ▶ MMT generates index for MathWebSearch
    - [Kohlhase et al.]
- ▶ Change management
  - ▶ export/detect dependencies between library items
  - ▶ detect changes between library versions
  - ▶ propagate changes along dependencies

# Example Service: The MMT Browser

## The MMT Web Server

[Graph View](#) [Search](#) [Administration](#) [Help](#)

Style: html5

code.google.com / p / hol-light / source / browse / trunk ? bool

- hollight
  - arith.omdoc
  - bool.omdoc
  - calc\_int.omdoc
  - calc\_num.omdoc
  - calc\_rat.omdoc
  - cart.omdoc
  - class.omdoc
  - define.omdoc
  - ind\_defs.omdoc
  - ind\_types.omdoc
  - int.omdoc
  - iterate.omdoc
  - lists.omdoc
  - nums.omdoc
  - pair.omdoc
  - real.omdoc
  - realarith.omdoc
  - realax.omdoc
  - sets.omdoc

**bool**

**T** [show/hide type](#) [show/hide onedim-notation](#) [show/hide tags](#) [show/hide metadata](#)

**T\_DEF** [show/hide type](#) [show/hide tags](#) [show/hide metadata](#)

**TRUTH** [show/hide type](#) [show/hide definition](#) [show/hide tags](#) [show/hide metadata](#)

**^** [show/hide type](#) [show/hide onedim-notation](#) [show/hide tags](#) [show/hide metadata](#)

**AND\_DEF** [show/hide type](#) [show/hide tags](#) [show/hide metadata](#)

**=>** [show/hide type](#) [show/hide onedim-notation](#) [show/hide tags](#) [show/hide metadata](#)

**IMP\_DEF** [show/hide type](#) [show/hide tags](#) [show/hide metadata](#)

**!** [show/hide type](#) [show/hide onedim-notation](#) [show/hide tags](#) [show/hide metadata](#)

**type**  $\{A:\text{holtype}\}(A \Rightarrow \text{bool}) \Rightarrow \text{bool}$

**onedim-notation**  $\forall x:_. a$  (precedence 0)

**FORALL\_DEF** [show/hide type](#) [show/hide tags](#) [show/hide metadata](#)

**type**  $\{A:\text{holtype}\} \vdash (!A) = \lambda P:A \Rightarrow \text{bool} . P = \lambda x:A . T$

## Browser Features: 2-dimensional Notations

**REAL\_POW\_DIV**

show/hide type

show/hide definition

type  $\vdash \forall x:\text{real} . \forall y:\text{real} . \forall n:\text{num} . \left(\frac{x}{y}\right)^n = \frac{x^n}{y^n}$

# Browser Features: Type Inference

The image shows a browser interface with a list of items on the left and a context menu open over one of them. The list items are:

- FORALL\_DEF** show/hide type show/hide tags show/hide metadata  
type  $\{A : \text{holtype}\} \vdash (!A) = \lambda P : A \Rightarrow \text{bool} . P = \lambda x : A . T$
- ? show/hide type
- EXISTS\_DEF** show
- ✓ show/hide type
- OR\_DEF** show/hide
- F** show/hide type  
type bool

The context menu is open over the first item and contains the following options:

- reconstructed types >
- implicit arguments >
- redundant brackets >
- infer type** (highlighted with a mouse cursor)
- simplify
- fold

The 'infer type' option is selected, and a secondary window titled 'type' is displayed to the right, showing the inferred type:

**type**   
 $(A \Rightarrow \text{bool}) \Rightarrow \text{bool}$

# Browser Features: Parsing

Enter an object over theory:

analyze  simplify

```
[x]  $\forall y. \exists z. y = x + z$ 
```

result:  $[x] \forall y. \exists z. y =_{\text{num}} x + z$

inferred type:  $\{x : \text{num}\} \text{bool}$

## Example Service: Search

Enter Java regular expressions to filter based on the URI of a declaration

Namespace

Theory

Name

Enter an expression over theory

Use \$x,y,z:query to enter unification variables.

Search

type of **MOD\_EQ**

$\vdash \forall m:\text{num} . \forall n:\text{num} . \forall p:\text{num} . \forall q:\text{num} . m = n + q * p \implies m \text{ MOD } p = n \text{ MOD } p$

type of **MOD\_MULT\_ADD**

$\vdash \forall m:\text{num} . \forall n:\text{num} . \forall p:\text{num} . (m * n + p) \text{ MOD } n = p \text{ MOD } n$

# Conclusion

- ▶ Complete export of HOL LIGHT
  - ▶ Kernel
  - ▶ Library files as independent theories
- ▶ MMT services available for HOL LIGHT users
  - ▶ Interactive browsing, search, parsing
- ▶ Future work
  - ▶ Refactoring (to introduce heterogeneity)
  - ▶ Correspondences between concepts in different libraries
    - ▶ as an MKM concept
    - ▶ partial morphisms?
