Assignment1 - Prolog

Problem 1.1 (Basic Prolog Functions)

Implement the *functions* listed below in *Prolog*. Note that many of them are built-in, but we ask you create your own functions.

1. a function reversing a list

Test case:

```
?- myReverse([1,2,3,4,2,5],R).
R = [5, 2, 4, 3, 2, 1].
```

2. a function removing multiple occurrences of elements in a list Test case:

```
?- removeDuplicates([1,1,1,1,2,2,3,4,1,2,7],A).
A = [1, 2, 3, 4, 7].
```

Hint: You may want to *implement* a helper method delete(X,LS,RS), that removes all instances of X in LS and returns the result in RS.

3. a function for zipping two lists

zip takes two lists and outputs a list of pairs (represented as 2-element lists) of elements at the same index in the two lists. If the lists do not have the same length, the zipped list contains only as many pairs as the shorter list.

Create a *Prolog* predicate with 3 arguments: the first two are the two lists to zip and the third one the result. For instance:

```
?- zip([1,2,3],[4,5,6],L). ?- zip([1,2],[3,4,5],L). 
L = [[1, 4], [2, 5], [3, 6]]. L = [[1, 3], [2, 4]].
```

4. a function for computing permutations of a list

Try it out on paper first and understand why this is difficult.

Test case:

```
?- myPermutations([1,2,3],P).
P = [1, 2, 3];
P = [2, 1, 3];
P = [2, 3, 1];
P = [1, 3, 2];
P = [3, 1, 2];
P = [3, 2, 1].
```

Note that there are two ways for specifying such a function:

- (a) return a list of all permutations
- (b) return a single permutation each time such that *Prolog* finds them one by one.

Here we are using the second way, i.e., myPermutations(L,P) must in particular be true if P is some permutation of L.

Hint: One possible solution is to start with a helper predicate takeout(X,L,M) that is true iff M is the result of removing the first occurrence of X from L. Or equivalently: M arises by adding X somewhere in L. How does this allow you to define the notion of permutation recursively?

Problem 1.2

1. Program a *Prolog* predicate uadd for addition and umult for multiplication in unary representation.

Hint: The number 3 in unary representation is the *Prolog* term s(s(s(o))), i.e. application of the arbitrary function s to an arbitrary value o iterated three times.

Hint: Note that *Prolog* does not allow you to program (binary) functions, so you must come up with a three-place predicate. You should use add(X,Y,Z) to mean X + Y = Z and program the recursive equations X + 0 = X (base case) and X + s(Y) = s(X + Y).

2. Write a *Prolog* predicate ufib that computes the n^{th} Fibonacci Number (0, 1, 1, 2, 3, 5, 8, 13,... add the last two to get the next), using the addition predicate above.

If you have mastered addition and multiplication, feel free to try your hands on exponentiation as well.

Problem 1.3 (Binary Tree)

A binary tree of (in this case) natural numbers is inductively defined as either

• an expression of the form tree(n,t1,t2) where n is a natural number (the label of the node) and t1 and t2 are themselves binary trees (the children of that node)

• or nil for the empty tree. (Normally a tree cannot be empty, but it is more convenient here to allow an empty tree as well.)

In particular, the nodes of the form tree(n,nil,nil) are the *leaf* nodes of the tree, the others are the *inner* nodes.

An example tree in Prolog would be:

```
tree(1,tree(2,nil,nil),tree(2,nil,nil))
```

1. Write a *Prolog* function construct that constructs a binary tree out of a list of (distinct) numbers such that for every subtree tree(n,t1,t2) all values in t1 are smaller than n and all values in t2 are larger than n.

Note that there are usually multiple such trees for every list. One example is:

```
?- construct([3,2,4,1,5],T).
T = tree(3, tree(2, tree(1, nil, nil), nil), tree(4, nil, tree(5, nil, nil))).
```

- 2. Write *Prolog* functions count_nodes and count_leafs that take a binary tree and return the number of nodes and leaves, respectively.
- 3. A binary tree is symmetric if it is its own mirror image, i.e., all nodes have left and right child switched. Write a *Prolog* function symmetric that checks whether a binary tree is symmetric.
